INTERPRETATION			IG
A negative ANAchoice(TM) Cascade following a positive ANA-IFA indicates the absence of detectable antibodies to component analytes consisting of dsDNA, Chromatin, RNP, Sm/RNP, Sm, SSA, SSB, Jo-1, Centromere B, Scl-70 and Ribosomal P. A positive ANA-IFA and negative ANAchoice(TM) Cascade should be interpreted in the context of the clinical and laboratory findings, and does not rule out autoimmune disease characterized by other autoantibody specificities, including autoimmune hepatitis and primary biliary cirrhosis.
