According to ADA guidelines, hemoglobin A1c <7.0% represents optimal control in non-pregnant diabetic patients. Different metrics may apply to specific patient populations. Standards of Medical Care in Diabetes-2013. Diabetes Care. 2013;36:s11-s66 For the purpose of screening for the presence of diabetes <table><tr><td><5.7%</td><td>Consistent with the absence of diabetes</td></tr><tr><td>5.7-6.4%</td><td>Consistent with increased risk for diabetes (prediabetes)</td></tr><tr><td>>or=6.5%</td><td>Consistent with diabetes</td></tr></table> This assay result is consistent with diabetes mellitus. Currently, no consensus exists for use of hemoglobin A1c for diagnosis of diabetes for children.				<5.7%	Consistent with the absence of diabetes	5.7-6.4%	Consistent with increased risk for diabetes (prediabetes)	>or=6.5%	Consistent with diabetes
